Desktop Environment Options

One of the most popular graphical desktops is the GNOME desktop. This is one of many alternative graphical desktops available in the Linux environment, such as KDE and XFCE. Since Linux uses the command line interface by default, the graphics environment is layered on top of software components that provide a comprehensive graphical environment. The layered software approach allows for changing all or some of the graphical desktop environment components for both the default user configuration or on a per-user basis. There are many desktops, and since they are a layered application, one can select from many offerings that meet the user's requirements.
