

Web User Interface (WUI)

The web user interface (WUI) uses a web browser to provide access to content, servers, or applications. The web user interface allows access to systems on the cloud and configures the system remotely. Today's modern computing environment requires a browser and internet connection to access system resources on a cloud. The WUI can be used from any web-enabled device. An example of a WUI is the application **cockpit**.
