LINUX FILESYSTEMS AND FILE MANAGEMENT

Filesystems

Filesystem Types

Filesystems come in many flavors; some of them are listed in the table below.

Table 5.1: List of Filesystem Types and Their Descriptions

FILESYSTEM TYPE	DESCRIPTION
FAT, VFAT, FAT32	Older types, compatible with most operating systems. They have limited capabilities.
EXFAT	The latest in the FAT (File Allocation Table) family.
ext2, ext3	These are older versions of the ext (extended) filesystem family. This used to be a native filesystem in Linux. It is still supported.
ext4	The current default filesystem on many Linux distributions. It is backward-compatible with ext2 and ext3 . Has improvements in volume size and journaling.
XFS	This is a high-performance journaling filesystem. Fast recovery with large file size support.
NTFS	This is a proprietary journaling filesystem developed by Microsoft, and is a replacement for FAT filesystems.
btrfs	This is a modern filesystem for Linux, aiming to implement advanced features while focusing on fault tolerance, repair and easy administration. Ongoing development of its features.
